Groundwater resources play an important role in New Mexico's drinking water supply in urban and rural areas. Additional water needs for mining, oil & gas, industry, agriculture, and for sustaining ecology add demand stress to an already limited supply. Realistic water planning to achieve optimal use of the state's aquifers is essential if New Mexico is to achieve a long-term sustainable supply/demand balance. The Annual New Mexico Groundwater Conference provides updates on aquifer assessment studies and explores challenges in water planning and implementation. The 2021 program includes discussion of the following topics:

- Using sound science for quantifying climate change impacts on future hydrologic conditions
- Making use of wells to develop deep aquifers, and employing directional drilling technologies in shallow aquifers
- Reviewing how produced water from oil & gas operations can be beneficially managed
- Demonstrating how new approaches to water data storage and retrieval will help water management decisions
- Providing updates and insight about practical ways to deal with PFAS contamination
- Considering water rights, unsettled indigenous water claims and rural water governance
